Computational Phylogenetic Methods and Austronesian Subgrouping

Russell D. Gray, Simon Greenhill, and Robert Blust
University of Auckland and University of Hawai‘i

In this talk we will outline the power and potential pitfalls of applying Bayesian phylogenetic methods to the task of inferring linguistic relationships. We will analyze a large database of basic vocabulary for over 300 Austronesian languages (see http://language.psy.auckland.ac.nz/). The ability of Bayesian phylogenetic methods to recover accepted Austronesian subgroups and generate novel results will be discussed.
